

Installing Jupyter

Get up and running on your computer

Project Jupyter's tools are available for installation via the Python Package Index (<https://pypi.org/>), the leading repository of software created for the Python programming language.

This page uses instructions with pip (<https://pip.pypa.io/en/stable/>), the recommended installation tool for Python (<https://packaging.python.org/en/latest/guides/tool-recommendations/#installation-tool-recommendations>). If you require *environment management* as opposed to just installation, look into conda (<https://docs.conda.io/>), mamba (<https://mamba.readthedocs.io/>), pipenv (<https://pipenv.pypa.io/>), and Homebrew (<https://brew.sh>).

JupyterLab

Install JupyterLab with pip:

```
pip install jupyterlab
```

Note: If you install JupyterLab with conda or mamba, we recommend using the conda-forge channel (<https://conda-forge.org/>).

Once installed, launch JupyterLab with:

```
jupyter lab
```

Jupyter Notebook

Install the classic Jupyter Notebook with:

```
pip install notebook
```

To run the notebook:

```
jupyter notebook
```

Voilà

Install Voilà with:

```
pip install voila
```

Once installed, launch Voilà with:

```
voila
```

Homebrew

Homebrew (<https://brew.sh>) is a package manager for macOS and Linux. You can use it to install Jupyter by running:

```
brew install jupyterlab
```
